PF22 FOAM CANNON

Innovation Design Quality

The Innovation of the PF22 Foam Cannon lies in the nozzle. This foam cannon offers not only adjustable fan blades but now offers an adjustable spray pattern (vertically or horizontally) as it throws thick foam onto your vehicle, house, fence, sidewalk, roof or other washable items. The chemical injection knob on top allows for more or less chemical to be drawn through the internal chamber, increasing or decreasing the foam output. This allows the internal agitator to create a dense foam.

PORTABLE HEATERS

Whether you're curing concrete, warming equipment or heating spaces, you'll work faster and smarter with Veloci portable heaters. Our versatile, Italian-engineered radiant and forced-air heaters are built for performance, allowing you to get more done in a day.

Flame115 Made In Italy

› Radiant Heaters

Are characterized by the absence of moving air, the flame generated by the burner heats the front plate which reaches high temperatures and projects heat outward. Our infrared diesel heaters also have an embedded burner with dedicated fan for a cleaner combustion. This helps to burn and stop all combustion residues, guaranteeing a clean combustion and 99.9% efficiency. Their versatile use allows them to heat objects and spaces more efficiently than traditional heat sources.

› The Innovation Of The Flame115 Infrared Heater

Lies in the elimination of the refractory material cone that surrounds the conical combustion chamber that's typical of other competitor's units. Our heater features a metallic forced air insulation pocket between the combustion chamber and the external protection cone. The cooling air is blown through the pocket by the burner fan. This innovative technology over comes the well-known problem of the fragility and brittleness of the ceramic cone.

BTU/h Requirements

To determine the BTU/h needed to heat a given area, first, determine the total cubic feet of the area (length x width x height). Secondly, determine your desired temperature rise (your current room temperature is 50°F, your desired temperature is 70°F, your rise in temperature is 20°F). Lastly, where your cubic feet row intersects with your rise in temperature column, is your needed BTU/h to heat the area (see highlighted cells for reference).
